

**APPENDIX V: Treatment algorithms for NVP and HG in primary care (Vai and ii), ambulatory care (Vb), emergency department (Vc) and inpatient care (Vd)**

**Vai. Summary for General Practitioners**

Royal College of Obstetricians & Gynaecologists

**GPCPC**

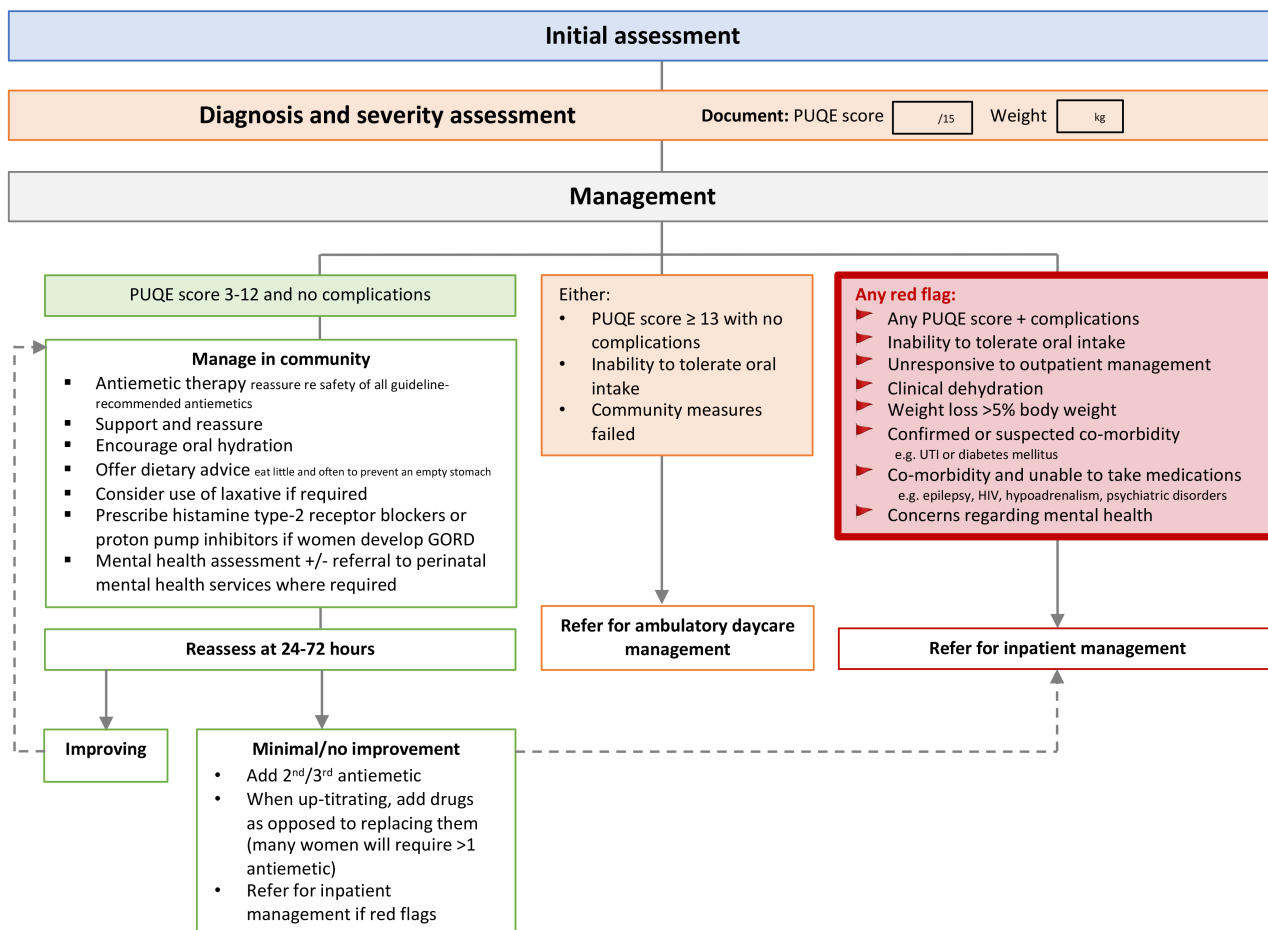

**Why is the active management of nausea and vomiting of pregnancy (NVP)/ hyperemesis gravidarum (HG) important?**

- NVP/ HG is associated with serious health consequences for both mother and baby
- Patients with NVP/HG often present to primary care as onset of symptoms occur prior to their pregnancy being booked by a midwife
- Patients are likely to have tried non-pharmacological options prior to presenting thus they may have severe disease at first presentation to primary care

**Practice points for general practitioners:**

- Validate patients' symptoms
- There are safety and efficacy data for first line antiemetic therapy including anti (H1) histamines, phenothiazines and doxylamine/pyridoxine and they should be prescribed when required for the management of NVP/HG
- In patients with severe disease multiple antiemetics prescribed together will be required
- Ketonuria is not an indicator of dehydration and should not be used to assess severity of NVP/HG
- Guidance for referral to secondary care is included in the algorithm below
- NVP/HG is likely to recur in subsequent pregnancies and pre-emptive use of medication can reduce severity of disease future pregnancies
- An assessment of mental as well as physical is important

**Recommended simplified management algorithm for management of NVP/HG in primary care (for detailed algorithm see appendix Vaii):**

Vaii. Management of Nausea and Vomiting of Pregnancy (NVP)/ Hyperemesis Gravidarum (HG) in General Practice

**Initial assessment**

**History:**

- Previous history of NVP/HG
- Ptyalism (hypersalivation)
- Weight loss
- Poor oral intake
- Effect on quality of life
- Effect on mental health/mood

*Consider other causes in those with:*

- Abdominal pain
- Urinary symptoms
- Infective symptoms
- Possible drug cause
- Chronic H. pylori infection

**Examination:**

*Observations:*

- Temperature
- Heart rate
- Blood pressure
- Respiratory rate

*Physical examination:*

- Signs of dehydration
- Signs of malnutrition
- Abdominal examination
- Neurological signs

Presence of confusion, nystagmus or ataxia should raise suspicion of Wernicke's encephalopathy

**Investigations:**

- Urine dipstick +/- MSU   
nitrites may indicate urinary tract infection  
NB. Ketones are not a marker of dehydration
- Urea and electrolytes   
to assess for hypo/hyperkalaemia, hyponatraemia, kidney injury
- Full blood count   
infection, raised hb or Hct may indicate dehydration
- Blood glucose   
to assess for diabetes

**Diagnosis and severity assessment**

Document: PUQE score  Weight

**Diagnosis:**

**NVP:**

- onset of nausea and/or vomiting in early pregnancy with no other cause is identified

**HG:**

- Nausea and vomiting (one of which is severe)
- Onset <16 weeks' gestation
- Inability to eat and drink normally
- symptoms limit daily activity

**PUQE-24 scoring system:**

In the last 24 hours:

	Not at all [1]	≤1h r[2]	2-3hrs [3]	4-6hrs [4]	>6hrs [5]
How long have you felt nauseated or sick to your stomach for?					
How many times have you vomited?	0x [1]	1-2x [2]	3-4x [3]	5-6x [4]	≥7x [5]
How many times have you had retching or dry heaves?	0x [1]	1-2x [2]	3-4x [3]	5-6x [4]	≥7x [5]

**Management**

**PUQE score 3-12 and no complications**

**Manage in community**

- Antiemetic therapy reassure re safety of all guideline-recommended antiemetics
- Support and reassure
- Encourage oral hydration
- Offer dietary advice eat little and often to prevent an empty stomach
- Mental health assessment +/- referral to perinatal mental health services where required

Reassess at 24-72 hours

Improving

Minimal/no improvement :  
Add 2<sup>nd</sup>/3<sup>rd</sup> antiemetic  
Refer for inpatient management if red flags

**Either:**

- PUQE score ≥ 13 with no complications
- Inability to tolerate oral intake
- Community measures failed

**Refer for ambulatory daycare management**

**Any red flag:**

- ▶ Any PUQE score + complications
- ▶ Inability to tolerate oral intake
- ▶ Unresponsive to outpatient management
- ▶ Clinical dehydration
- ▶ Weight loss >5% body weight
- ▶ Confirmed or suspected co-morbidity e.g. UTI or diabetes mellitus
- ▶ Co-morbidity and unable to take medications e.g. epilepsy, diabetes mellitus, HIV, hypoadrenalism and psychiatric disorders
- ▶ Concerns regarding mental health

**Refer for inpatient management**

**Antiemetic therapy**

**1<sup>st</sup> line** Doxylamine and pyridoxine 20/20mg PO at night, increase to additional 10/10mg in morning and 10/10mg at lunchtime if required.  
Cyclizine 50 mg PO, IM or IV 8 hourly  
Prochlorperazine 5-10 mg 6-8 hourly PO (or 3 mg buccal) ; 12.5 mg 8 hourly IM/IV; 25 mg PR daily  
Promethazine 12.5-25 mg 4-8 hourly PO, IM or IV  
Chlorpromazine 10-25 mg 4-6 hourly PO, IM or IV

**2<sup>nd</sup> line** Metoclopramide 5-10 mg 8 hourly PO, IV/IM/SC  
Domperidone 10 mg 8 hourly PO; 30 mg 12 hourly PR  
Ondansetron 4 mg 8 hourly or 8mg 12 hourly PO; 8 mg over 15 mins 12 hourly IV; 16mg daily PR  
Women taking ondansetron may require laxatives if constipation develops

**3<sup>rd</sup> line** Prednisolone 40-50 mg daily PO, with the dose gradually tapered until lowest maintenance dose that controls the symptoms is reached  
Corticosteroids should be reserved for cases where standard therapies have failed; when initiated they should be prescribed in addition to previously started antiemetics. Women taking them should have their BP monitored and a screen for DM

**Other considerations**

**Up titration of antiemetics:**

- Initially select a 1<sup>st</sup> line antiemetic
- Use combinations of drugs in women who do not respond to a single antiemetic
- When up titrating add drugs as opposed to replacing them different classes of drugs may have synergistic effects and some women will require a combination of 3+ antiemetics to control symptoms

**For all patients consider:**

- Histamine type-2 receptor blockers or proton pump inhibitors if women develop GORD Both safe in pregnancy
- Thiamine supplementation in those with severely reduced dietary intake
- Laxatives if required for constipation
- VTE risk assessment (see RCOG risk assessment tool)

**Post-partum care, planning for future pregnancy and signposting**

- Patients with severe HG are risk of PTSD if required they should be referred to appropriate services
- In future pregnancy early use of lifestyle modifications should be used
- Pre-emptive use of doxylamine and pyridoxine can be used to reduce severity of disease in subsequent pregnancy 20/20mg PO at night to be started on confirmation of positive pregnancy test and up titrated when required
